

Aurascape Al Security At a Glance

Key Benefits

Discover Al Use

Gain full visibility into all Al applications, copilots, agents, and embedded Al—across known and emerging tools, with zero-day application support.

Control Al Intent

Set risk-aware usage policies that account for user identity, intent, and the context of the conversation—enabling safe access without stifling innovation.

Safeguard Al Activity

Protect sensitive data and prevent Al-driven threats with real-time classification, fingerprinting, and threat detection for both prompts and responses.

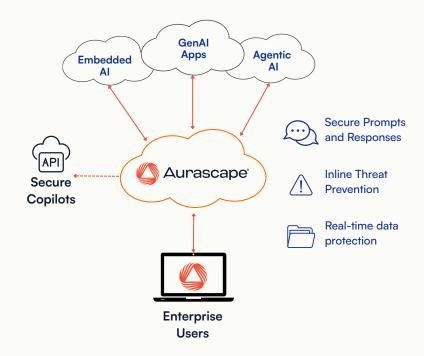

Streamline Operations

Natural language summaries, automated reporting, and user coaching help security and compliance teams stay informed without added overhead.

From Shadow AI to Secure AI

Firewalls and Secure Web Gateways were built for a pre-Al world—when apps used standard protocols and data exposures followed predictable patterns. Today's Al tools operate differently. They use opaque, custom protocols, stream data continuously, and are rapidly embedding themselves into existing trusted applications—making them invisible to traditional security solutions.

Aurascape closes that visibility and control gap. As an Alnative security layer, Aurascape gives you real-time visibility and control over Al usage across your entire organization. It empowers teams to adopt Al responsibly—by discovering, classifying, and securing Al activity without disrupting productivity or innovation.

Aurascape automatically discovers and maps thousands of AI applications—providing full visibility and granular access control for both known and emerging tools. It goes beyond prompt monitoring to deliver full-context insight into entire AI conversations, identifying user intent and risk in real time. Intelligent data classification and threat inspection enable precise, policy-driven controls that prevent data loss and block AI-driven threats without disrupting productivity.

Key Solutions

Al Data Protection

Protect sensitive data and ensure compliance with real-time data categorization and intent-aware data protection policy enforcement—driven by full conversational context.

"Considering AI is now in almost every tool that our employees use, we wanted to further strengthen our security posture. Aurascape provided that for us."

Control Shadow Al

Enable safe Al adoption by blocking unsanctioned tools, allowing approved apps with guardrails, and ensuring only enterprise accounts—not personal ones—can access sensitive data.

Guardrails for Coding

Let developers use AI in their workflows without leaking critical code to untrusted systems. Enforce intention-based policies to block or nudge users away from unsafe apps and actions.

Secure Al Copilots

Detect and tag sensitive information before it can be learned by AI copilots. If exposure has already occurred, flagged content is automatically unlearned—ensuring your data stays protected.

Secure Agentic Al

Agentic AI chains over MCP introducw new risk pathways —often invisibly. Aurascape delivers real-time visibility and context driven policy control giving you the confidence to embrace agentic AI.
